THE ART OF PRODUCTION

Gaudi is a leading manufacturer of polyurethane foam products in Europe. The company has an extensive technical and scientific base and a multidisciplinary team of highly qualified experts. Vast experience, advanced technologies, and innovative equipment enable the company to deliver excellent products to customers and thus, to capture a major share in the market.

Gaudi road to Success

The history of the Gaudi trademark started over 15 years ago, with the production of elastic slab-stock (for furniture production) and elastic cast (finished soft parts for furniture) polyurethane foam. Meanwhile, related sectors providing incoming material quality control, laboratories carrying out product output parameters, monitoring and the production zones for components and casting forms for soft cast elements manufacture, were developed. As a result, a large Production Department was created. It performs such tasks as both conducting independent research and effective cooperation with the research laboratories of the largest manufacturers of raw materials and equipment (Dow Chemical, Bayer, BASF, CANNON, KRAUSMAFFEL, SIEMENS, ABB). All the production facilities of the company have been developed due to this cooperation, on the basis of the technical design specifications of the Gaudi specialists, and are truly unique. Our dynamically developing production structure has enabled us to master production of hard cast products and architectural decoration elements in the shortest time, and to take one of the leading positions in this market, increasing turnover every year. Today, the plant producing the architectural decoration elements under the Gaudi trademark is the largest plant manufacturing such products in Europe, and it is one of the largest ones in the world. It has representative offices in more than 60 cities in Russia, Belarus, Ukraine, Kazakhstan, Azerbaijan and Moldova. Each representative office has a warehouse for products, making it possible to deliver the required goods to the client "right here, right now". Every month Gaudi launches new items to expand its product range. Gaudi specialists, together with an architect and a professor of Moscow University of Architecture Boris Sukharev, have created a collection of facade decoration elements based on classical Greek orders. The main principle of the company is the effective combination of financial, human and technical resources for manufacturing diverse polyurethane foam products. The Gaudi concept is meeting demands of consumers who want to purchase high quality domestic products.

Gaudi – Technological Development

The quality of a finished product largely depends on the casting form. Production of such forms is a serious problem for many manufacturers. After almost fourteen years of work, the company specialists have developed a unique technology that enables them to produce casting forms of any configuration. A small facility for the forms' production has turned into a workshop, manufacturing between 30 and 40 forms every month for all cast products made of polyurethane foam (soft parts of furniture, architectural decoration elements).

An occurring problem faced in the production of cast polyurethane foam products is connected with the raw materials usage. As experience shows, procurement of outsourcing components leads to unpredictable results: a change of shrinkage degree of the architectural decoration elements, a change of the soft cast elements rigidity, etc. However, the majority of manufacturers have to purchase components for a variety of reasons, and therefore the quality of the manufactured products suffers. Gaudi solved this problem by creating its own production facilities for components manufacture. Experimental products are made from components produced here, their physical and mechanical characteristics are measured (shrinkage, density, surface rigidity) and the compounding is changed if necessary. This procedure guarantees that the customer will receive products distinguished by the highest quality. At the present time, production facilities for manufacturing of components have also become a workshop, which provides raw materials to all branches of polyurethane foam products manufacturing.

From the day of its foundation, the company has focused on achieving superior quality, dependability and maximum efficiency. Striving to excel in all areas of strategic importance to the company, continuous innovation and applying of groundbreaking, often exclusive technologies, enable Gaudi to remain its leadership in the market and to compete successfully with recognized global companies.

THE ART OF TECHNOLOGY

Production of the architectural decoration elements is a complicated and high-technology process. Historically, architectural decoration elements were made of gypsum, the main advantage of which was the possibility to obtain products of any configuration. With the development of science, new technologies for manufacturing of such products appeared. Architectural decoration elements made of polyurethane foam are the most similar to those made of gypsum.

High density polyurethane foam are absolutely inert and do not interact with the environment. Due to their properties, they are widely used in different spheres, including medicine – such as bone implants. The density of all Gaudi products is 300 kg/m³. This is the minimum density at which their production does not require the use of hydrochlorofluorocarbon. In order to obtain lower density products, it is required to use hydrochlorofluorocarbon, which is preserved in the products and also penetrates the room atmosphere in the operating process. Gaudi takes care of its consumers' health and deliberately increases the prime cost of its products (manufacturing of products distinguished by high density), refusing technology that involves applying of dangerous hydrochlorofluorocarbon. Besides, the high density provides lower shrinkage and greater rigidity of the products. It is possible to divide the manufacturing process of the decoration elements of polyurethane foam into several stages.

Manufacturing of Casting Forms for Products

This is one of the crucial stages of the whole production process, as the appearance of the products depends on the casting forms. In contrast to the gypsum technologies, polyurethane foam not only hardens, but also significantly expands, filling all the internal space of the form, while its walls are also under high pressure. Therefore, it is possible to obtain a product that is identical to the form. The form must be very firm. On the other hand, form rigidity results in restriction of possible configurations of the products. The component must be extracted from the solid form and it must not damage it. Many manufacturers face a problem at this stage

because they can not cast products with non-standard configurations and complicated patterns. In this case, Gaudi produces forms from carbon; it is a modern material that has a higher density compared to metal. This technology appeared as a result of conversion of military-industrial complex technologies, and it enables the production of extremely solid forms of almost any configuration. Such equipment can survive not less than 50000 casting procedures and provides high reproducibility: cast components practically do not differ from each other. High cost is its only drawback. Not all manufacturers of polyurethane foam products can reproduce the form production from composite materials. The technology of carbon form production is an exclusive development of Gaudi. If the product configuration is rather simple, the form is produced from a piece of metal using special multi-axis boring machines.

Preparation of the Raw Materials

Production of polyurethane foam is a complicated process and nevertheless, there are many unexplored facts related to it. For example, the same raw materials can have different results when different types of equipment are used. It is known that one batch of raw materials can slightly differ from another. Sometimes the difference is not significant, but often such differences cause considerable changes in the properties of the finished products. Our laboratory of component production enables us to avoid such problems. Gaudi laboratory's specialists provide incoming control of all raw materials used for production of components, and on the basis of its results, the Production Department corrects its compounding.

Production of Decoration elements

Gaudi uses the most modern equipment of leading global companies for manufacturing its products: CANNON, KRAUSMAFFEL, SIEMENS, ABB. Firstly, it enables us to automate the process of component mixing and dosing; each machine unit is equipped with a powerful computer with programs for each product casting, which excludes negative influence of the human factor. Secondly, all machine units are equipped with modern devices that enable us to provide precise dosing of the components and to support that proportion for a long period of time. The architectural decoration elements differ from each other by weight, size and configuration. Special equipment and settings of the production process organization are required for some of the components. For example, a high capacity dispensing machine is required for casting of large and elongated parts, such as columns, but the machines distinguished by low capacity and high dosing accuracy are required for casting of the decoration elements. In order to achieve the highest quality of the products, there are 4 casting zones at the Gaudi plant that provide optimal conditions for the production of various components.

Final product touches

Overall dimensions of the components upon casting differ from one another but all Gaudi products are compatible with the rest. The high level of compatibility of the components with each other upon casting is achieved by means of additional precision processing. Profiles of two similar components match each other precisely, and if a part of any size is cut from any product part, the

profiles of two remaining parts will also match each other precisely. Gaudi technicians take into account inertness of polyurethane foam. If no special measures are taken, it won't be possible to glue and paint the finished material (glue and paint will not penetrate; the glue does not dissolve the surface layer). During the mechanical processing a surface that is specially prepared for gluing is created on the inner side. Before the products are painted they are covered with a special polyurethane foam coating that is distinguished by its good adhesion to polyurethane foam products, and paint spreads well on their surface.

Quality Control

At all stages of the production process, independent full outgoing and incoming quality control is conducted.

Gaudi constantly improves its polyurethane foam production technologies, discovering innovative solutions, and offering its customers products, quality and consumer properties of which compare favorably to products represented in the catalogues of other companies.
